Hints for making your Applet run on the web:

1. Set the layout (of the Applet) to Null Layout (otherwise it won't work!).

2. Recall that your public_html directory is the root of your web presence. What you see as:
   
   /Volumes/jstudent/public_html,

   looks to the world like
   
   http://www.willamette.edu/~jstudent
3. Also, recall that the byte code (the code that the JVM runs when your program executes) is in the classes directory, in the build directory, which is in the same directory as the src directory. That byte code needs to be somewhere in your public_html directory. If you had the Files tab open (as well as the Projects) tab, it looks like this...
Use the Finder to copy that build directory to your public_html directory. Right-click build and select copy (or cmd-c).

Then paste in public_html

Now you can point to it from your web page!
